

Date	15 July 2026
Team ID	SWTID-2026-3848
Team Size	4
Team Leader	Akula Charith
Team Member 1	Arkati Chenchusunil
Team Member 2	B Thulasidhar
Team Member 3	Bachu Harshitha
Project Name	Machine Learning – Based Credit Card Approval Prediction System
Maximum Marks	4 Marks

Project Executable Files

Introduction

The Project Executable files document describes the executable components, configuration file, learning models, templates, and supporting libraries required to successfully run the Machine Learning–Based System. These files collectively enable the execution, learning prediction, user interaction, and database connectivity.

Executable Components

	Executable Component	Description	Purpose
	app.py	Main Flask application	Starts the web application and coordinates all
2	model.pkl	Trained Machine Learning Model	Used to make credit card approval predictions.
3	encoders.pkl	Label Encoder File	Converts categorical input values into machine-readable numerical values.
4	scaler.pkl	Feature Scaling File	Normalizes input features for better model performance.
5	requirements.txt	Python Dependency File	Installs all required packages, libraries, and project dependencies.
6	templates/	Template Folder	Contains the web interface pages for user interaction.
7		JavaScript and Image Folder	Provides styling, client-side functionality, and static resources.
8	README.md	Project Documentation	Provides installation instructions, project overview, and execution steps.

Execution Requirements

Programming Language	Python 3.x
Web Framework	Flask
Machine Learning Libraries	- Scikit-learn - Pandas - NumPy
Database	MySQL
Development Environment	Visual Studio
Version Control	Git and GitHub
Deployment Platform	Render
Operating System	Windows 11

Conclusion

Application Execution Workflow

Key Features of Executable Files

- Modular project structure.
- Easy application deployment.
- Secure machine learning model loading.
- Efficient database integration.
- Responsive web interface.
- Scalable Flask architecture.
- Reusable software components.
- Simplified maintenance and future enhancements.

The executable components of the Machine Credit Card Prediction System provide a complete, modular, and maintainable software solution. The Flask application, trained machine learning model, configuration files, templates, and static resources ensure reliable application execution and accurate real-time credit card approval prediction.
